Men Adjust Easily to Simulated Satellite Rotation Says Report

Six men have demonstrated a surprisingly rapid adjustment to two-day tests in a room rotating in a manner that may be used to launch satellites, it was reported recently.

A report on the unique experiment by Dr. Ashton Greybiel, director of the U.S. Naval School of Aviation Medicine, Pensacola, Florida, was contained in a recent issue of the Archives of Neurology, published by the American Medical Association.

FOUR VOLUNTEERS at a time were locked inside the circular room 15 feet in diameter and 7 feet high, for two

days while it rotated at a constant speed. In six separate experiments the room was rotated at velocities ranging from 1.71 to 10 revolutions per minute.

The speeds were chosen to sample the range which might be used in orbiting satellite vehicles with a radius of 25 to 100 feet, Dr. Greybiel said.

During the experiment, the subjects were called upon to perform certain tests. The rest of the time they spent eating, sleeping, reading, listening to a radio, and talking.

ALL THE subjects except one, who had lost the function of the sensory organs of the inner ears, developed unpleasant symptoms, primarily discomfort, apathy, visual illusions, and nausea. In some instances the symptoms were so severe that the subjects were unable to carry out any useful tasks, he said.

"However," he said, "the degree and rapidity with which symptoms decreased or disappeared astonished both the experimenters and the subjects."

"IN GENERAL, the adaptation began in a matter of hours, and great improvement was observed by the end of the first day when the symptoms were mild and by the end of the second day when severe.

"The adaptation response emphasizes the extraordinary manner in which the central nervous system effects a readjustment to a discrepant sensory input, enabling the previously disturbed functions to operate effectively and probably normally for the new conditions."

Some symptoms reappeared after termination of rotation, Dr. Graybiel said, but these were less prominent than during the onset of rotation, and readaptation occurred "rather quickly."

THE FINDINGS have practical value, inasmuch as the velocities used were in the range of speed of rotation of manned radar platforms, and also may be in the range of speed rotation which may be used to launch satellites in the future, he said, adding: "The method would be useful in selection, indoctrination, and preconditioning of personnel."

He also said, it "holds promise in the study of the etiology and control of motion sickness."

Co-Op Nursery Registration Set Sept. 19th

The Torrance Co-op Nursery School, sponsored by the Torrance Adult Education, is now accepting applications for children between the ages of 3 and 5.

The school, now in its 10th year, is directed by a professional teacher, Mrs. Myrtle Barter, who has had extensive training in this field, working both with parents and the children.

Twenty-five families participate in the school's program with each mother taking an active part in the program as a teacher once a week. The project has a four-day program from 9 until 11:45 a.m., Monday through Thursday.

The school features a well equipped playground and spacious indoor area for such activities as fingerpainting, doughclay, hammer and nail construction, block building, story telling, and a rhythm section with piano accompaniment which are enjoyed by the children. Midmorning juice and crackers are served.

This year's registration date is set for Sept. 19 at the school at 4557 W. 182nd St., just west of Hawthorne Ave.

Defense Class Set

A civil defense class will be held at the Narbonne Baptist Church in Lomita at 10 a.m. Tuesday with George Powell, assistant director of civil defense for the city of Torrance, as the principal speaker.
